

Amitay Keisar

Full-Stack Software Developer

Kfar Saba, Israel · AmitayKeisar@gmail.com · +972-52-647-1797

github.com/amitayks · linkedin.com/in/amitaykeisar

Self-driven full-stack developer with deep expertise in mobile (React Native, Kotlin/Jetpack Compose), backend (Node.js, Hono, PostgreSQL), and AI integration (Claude Agent SDK, MCP, RAG pipelines). Builds end-to-end products from architecture to deployment — including CI/CD, Terraform infrastructure, and serverless systems. Designed and shipped production apps, real-time protocols, and developer tools across TypeScript, Kotlin, Rust, and Python.

TECHNICAL SKILLS

Languages: TypeScript · Kotlin · Rust · Python · JavaScript · SQL

Mobile: React Native · Jetpack Compose (MVI) · Hilt · Room · WorkManager · Fastlane · Custom Native Modules (iOS & Android)

Backend: Node.js · Hono · Drizzle ORM · PostgreSQL · pgvector · Redis · WebSocket · REST API Design

AI / ML: Claude Agent SDK · MCP Servers · OpenAI · Gemini · Deepgram · Gladia · RAG · Vector Embeddings · Voyage AI

Cloud & DevOps: Google Cloud Run · Terraform · Docker · GitHub Actions CI/CD · Cloudflare Workers/D1/R2 · Firebase

Security: E2EE (Signal Protocol) · X3DH · Double Ratchet · Google Cloud KMS · OAuth 2.0 · JWT · TOTP 2FA

PROJECTS

Addit — *AI Personal Assistant Platform · Full Product · 3 Codebases*

- Built an AI-powered voice assistant that transcribes calls, extracts actions (calendar, reminders, contacts, emails), and manages user memory (equivalent to OpenClaw) — **shipped V1 in React Native (iOS + Android), rebuilt V2 natively in Kotlin**
- Server: Claude Agent SDK with 4 MCP tool servers, subagent delegation, PostgreSQL + pgvector, Redis pub/sub, WebSocket device bridge, envelope encryption (Google Cloud KMS), deployed on Cloud Run via Terraform + GitHub Actions CI/CD
- Android: Jetpack Compose, MVI architecture, Hilt DI, Room (9 entities), device tool system (AI-driven file/contact/intent operations with user approval), Google Auth + 2FA, FCM push notifications
- React Native: local RAG pipeline with vector embeddings, custom native bridges, multi-provider AI (OpenAI/Gemini), multi-provider transcription (Gladia/Deepgram), background processing via HeadlessJS + WorkManager

Muse — *AI Content Automation Platform · Cloudflare Workers · TypeScript*

- Telegram-based content management system: auto-generates tweets from GitHub commits, AI-scored smart reposting from followed X accounts, handwrite mode with AI refinement, scheduling, and AI avatar video studio
- Cloudflare Worker with D1 database + R2 storage, 30+ tables, 65+ action handlers, Gemini AI for content generation + image art direction, zero runtime dependencies

AgentMesh — *P2P Encrypted Protocol for AI Agents · Rust + TypeScript + Python*

- Designed and built a 6-layer messaging protocol: Ed25519 identity, DHT discovery (Kademlia), KNOCK session establishment, Signal Protocol E2EE (X3DH + Double Ratchet), structured messaging, owner observability
- Registry API + relay server in Rust (Actix-web, Tokio), published JS SDK (@agentmesh/sdk) + Python SDK, 21 test suites, live at agentmesh.online

Also built: Bitbucket PR Reviewer (AI code review agent) · **Native-CC-Skill** (AI agent on 500+ pages of native app research) · **React Native Template** (custom RN template with native packages for iOS & Android) · **Visual Content Studio** (AI prompt engineering skill for image/video generation)

MILITARY SERVICE

Head of Logistics · **Unit 8200, Israel Defense Forces** · 2021 – 2024

- Sole operator of the logistics office for a 1,000+ soldier tech center — inherited a non-functional operation after supervisor departure, rebuilt processes, storage, and supply chains independently with no direct oversight
- Reduced equipment delivery time from 2+ days to under 30 minutes by establishing direct relationships with primary logistics centers; provisioned 500 emergency workstations during wartime operations
- Recruited, trained, and led two soldiers; built a self-sustaining operation where trained replacements took over seamlessly after handoff

EDUCATION

Self-Directed Software Engineering · 2021 – Present

4+ years of intensive self-study: JS, React, React Native, and TS foundations (Udemy), followed by self-taught Kotlin, Rust, Python, cloud infrastructure, AI/ML integration, protocol design, and native mobile development through building production software.
